

Quiz App Delivery Guide

A simple, clean plan to complete the task using UI/UX principles.

Step 1

Plan the experience

Keep the quiz flow short, clear, and focused.

Use one primary action per screen.

Choose a readable font, consistent spacing, and calm colors.

Step 2

Build the React interface

Create a single-page quiz layout.

Add a question card, answer buttons, and a progress bar.

Make feedback obvious with correct and incorrect states.

Step 3

Containerize with Docker

Use a multi-stage build for a small production image.

Serve the app with Nginx.

Expose the app on port 80 so deployment is predictable.

Quiz App Delivery Guide

Continue with deployment, monitoring, and a final delivery checklist.

Step 4

Set up a simple AWS host

Use one EC2 instance instead of a complex cluster.
Install Docker on the server.
Open only the ports you need for the demo.

Step 5

Automate deployment

Build and test in GitHub Actions.
Push the image to a registry.
SSH into EC2 and restart the container with the new image.

Step 6

Add basic monitoring

Send container logs to CloudWatch or a similar log store.
Track CPU usage and uptime.
Keep alarms simple and actionable.

Final checklist

- | | |
|-------------------------------------|----------------------------|
| â€¢ Clean UI with strong typography | â€¢ AWS EC2 hosting |
| â€¢ Dockerized app | â€¢ Logs and monitoring |
| â€¢ Automated build and deploy | â€¢ Clear README and guide |
